

Study & Focus Tracker Website

Course: CSE 106 – Fundamentals of Web Design

Name : Devvrat Kandpal

Group Members : Devvrat Kandpal

Hrishi Kumar Aggarwal

Section-B

1. Abstract

Many students face difficulties in staying focused, managing their study time effectively, and keeping track of their productivity. This project proposes the development of a **Study & Focus Tracker Website**, a frontend-based web application designed to help students plan study tasks, track focused study sessions, and reflect on their study habits. The website aims to provide a simple, interactive, and easy-to-use tool using basic web technologies.

2. Introduction

Time management and concentration are important skills for academic success, especially in demanding courses such as engineering. Although several productivity tools are available, many of them are complex or require additional setup and services. This project focuses on creating a lightweight web-based solution that demonstrates fundamental web design concepts while addressing a common student problem. The website will run entirely in a web browser and will be accessible without any additional software.

3. Problem Statement

Students often struggle to organize their study schedules, maintain focus during study sessions, and evaluate how productive their study time has been. There is a need for a simple and intuitive web-based application that allows students to manage tasks, track focused study sessions, and view basic productivity information without complicated features or setup.

4. Target Audience

The primary target audience for this project is **university students**, particularly **first-year engineering students**, who require simple tools to help manage their study time and improve focus. The website is designed to be user-friendly and accessible on different devices.

5. Proposed Solution

The proposed solution is a **Study & Focus Tracker Website** with the following features:

- Task management, allowing users to add, delete, and complete study tasks
- A focus timer based on the Pomodoro technique to encourage focused study sessions
- Session history to record completed study sessions
- Basic productivity statistics, such as total study sessions completed and total focus time

- Local storage of user data within the browser

All features will be implemented using frontend web technologies only.

6. Technology Stack

- **HTML5** – for structuring the website using semantic elements
- **CSS3** – for styling, layout, and responsive design using Flexbox and Grid
- **JavaScript** – for handling interactivity, timer functionality, and DOM manipulation
- **LocalStorage** – for storing user data on the client side
- **GitHub Pages** – for hosting and deployment of the website

7. Expected Outcome

The expected outcome of this project is a fully functional, responsive, and interactive study management website. The project will demonstrate an understanding of frontend web development concepts through the effective use of HTML, CSS, and JavaScript. The website will be deployed on GitHub Pages and accessible through a web browser.

8. Scope and Limitations

This project focuses only on frontend web development and is implemented using HTML, CSS, and JavaScript. The website runs entirely within a web browser and does not involve server-side processing. All user data, including tasks and study session records, is stored locally in the browser. As a result, the application does not support features such as user accounts, data synchronization across devices, or long-term data storage beyond the local system.
